20. ABSTRACT (Continue on reverse side if necessary and identify by block number) In anticipation of requirements to perform research on the impact of psychoactive drug use upon military performance, the U.S. Army Medical Research and Development Command (USAMRDC) contracted with Associate Consultants, Inc. to perform and compile a series of original reviews and analyses of the domestic and international scientific literature of the past 20 years. Reviews were conducted by experts in psychopharmacology with the primary

Block 19.

Opium Alkaloids	Physiology	Tranquilizer
PCP-Phencyclidine	Psychomotor Functions	Vision
Performance (Human)	Simulations	Visual Acuity
Physiological Effects	Stimulants	

Block 20.

Aims of:

- o documenting the current state of knowledge of drug effects upon militarily relevant performance;
- o documenting the gaps in knowledge of drug effects upon performance, particularly in situations analagous to those that may be created by rapid deployment of troops into continuous land warfare; and
- o making recommendations for future research projects.

The literature reviews are intended to establish a firm scientific basis for subsequent research programs and staff studies concerned with relating militarily-relevant performance capacity to various parameters of drug use.

Volume II of the report includes a cross-index of references cited in the reviews. The eight reviews in Volume I cover the literature on the major classes of drugs most frequently used in a recreational context: alcohol, cannabinoids, depressants, hallucinogens, opioids, and stimulants. One of the reports concerns phencyclidine piperidine (PCP). In addition, a special review deals with the effects of all these classes of drugs on visual performance and behavior.
